Preface	vii
1 Manufacturing systems modeling	1
1.1 The nature of mathematical models of manufacturing systems	1
1.2 Dynamic models of manufacturing systems	6
1.3 An overview of management problems in manufacturing systems	10
1.3.1 A hierarchy of management problems	10
1.3.2 Production scenarios and manufacturing systems layout	11
1.3.3 Performance measures	14
1.4 Plan of the book	17
For further reading	18
2 Optimization models and model solving	20
2.1 Classes of optimization models	21
2.1.1 Finite/infinite-dimensional problems	23
2.1.2 Linear/nonlinear problems	25
2.1.3 Continuous/discrete problems	26
2.1.4 Deterministic/stochastic problems	28
2.1.5 Single/multiobjective problems	29
2.2 An overview of optimization methods	30
2.3 Complexity of optimization problems	33
2.4 Good and bad model formulations	38
2.5 Developing heuristics from mathematical models	43
S2.1 The theory of NP-completeness	45
S2.2 An outlook on multiobjective optimization	49
For further reading	51
3 Discrete-time models	52
3.1 Aggregate Production Planning	53
3.1.1 The basic APP model	54

3.1.2	Extensions of the basic APP model	55
3.1.3	A decomposition approach for the basic APP model	56
3.2	The Capacitated Lot-Sizing Problem	60
3.2.1	Formulation of the CLSP	60
3.2.2	Solving the CLSP with standard MILP codes	61
3.2.3	A dual approach to the CLSP	63
3.2.4	The single-item uncapacitated lot-sizing problem . .	64
3.2.5	A modal formulation for the CLSP problem	68
3.2.6	Hierarchical approaches for CLSP	70
3.2.7	Multilevel lot-sizing	72
3.3	The Discrete Lot-Sizing and Scheduling Problem	74
3.3.1	The DLSP formulation	75
3.3.2	A dual decomposition approach for the multi-item DLSP problem	77
3.4	Continuous-flow models for production scheduling	77
3.4.1	Discrete-time dynamic models and trajectory tracking	78
3.4.2	A discrete-time continuous-flow model for batch pro- duction	82
3.5	Discussion: the flexibility of discrete-time models	89
3.5.1	Periodic scheduling in a press shop	90
S3.1	Strong formulations for lot-sizing problems	95
S3.2	The single item DLSP problem: a dynamic programming approach	98
	For further reading	100
4	DEDS models for scheduling problems	102
4.1	Classical machine scheduling theory	103
4.2	Classification of scheduling problems	106
4.2.1	Machine environment	106
4.2.2	Job characteristics	109
4.2.3	Objective functions	109
4.2.4	Semiactive, active and nondelay schedules	113
4.2.5	Nonstandard scheduling problems	115
4.3	Polynomial complexity scheduling problems	118
4.3.1	The SPT sequencing rule	119
4.3.2	The EDD sequencing rule	121
4.3.3	The Johnson algorithm	122
4.3.4	Complexity of preemptive scheduling	123
4.4	Dynamic programming approaches	125
4.4.1	Applying Dynamic Programming to single-machine problems	125
4.4.2	Solving $1/s_{ij}/*$ problems by Dynamic Programming	129
4.4.3	The curse of dimensionality	129
4.5	A modeling framework based on node potential assignment	130

4.5.1	Project networks	130
4.5.2	The disjunctive graph representation of job shop problems	132
4.6	MILP models for scheduling problems	135
4.6.1	Permutation modeling	135
4.6.2	Disjunctive graph based models	137
4.6.3	TSP-like modeling	139
4.6.4	Modeling with time-indexed variables	140
4.6.5	Modeling with assignment and selection variables	142
4.7	Branch and Bound methods	144
4.7.1	Integer programming approaches to machine scheduling	145
4.7.2	A Branch and Bound algorithm for $1/r_i/L_{\max}$	146
4.7.3	A Branch and Bound algorithm for the permutation $F//C_{\max}$ problem	148
4.7.4	Lagrangian relaxation approaches to machine scheduling	149
4.8	Heuristic scheduling methods	156
4.8.1	List scheduling and greedy methods	157
4.8.2	Dual heuristics for scheduling problems	161
4.8.3	Scheduling by simulated annealing	163
4.8.4	Scheduling by tabu search	167
4.8.5	LPT and Multifit algorithms for load balancing	172
4.8.6	Decomposition approaches to FJS and FMS scheduling	175
4.8.7	The Shifting Bottleneck procedure for $J//C_{\max}$	177
4.9	Discussion	179
S4.1	Dynamic Programming for scheduling a batch processor	181
S4.2	Periodic scheduling problems	182
S4.3	A multiobjective approach to machine loading	185
	For further reading	189
5	Evaluative models	191
5.1	Introduction to queueing models	192
5.1.1	Little's law	195
5.1.2	Elementary Markovian queueing models	195
5.1.3	Approximations for the $GI/G/1$ queue	198
5.2	Queueing networks	199
5.2.1	Two-machine queueing networks	200
5.2.2	Product form open queueing networks	202
5.2.3	Closed queueing networks	207
5.3	Computational methods for closed networks	209
5.3.1	The convolution algorithm	210
5.3.2	The Mean Value Analysis algorithm	213
5.4	Approximate analysis of nonproduct form queueing networks	215
5.4.1	Approximate Mean Value Analysis	216

5.4.2	A node decomposition approach for general queueing networks	217
5.5	Petri net models	219
5.6	Discussion	225
S5.1	Product forms and local balance equations	226
	For further reading	228
6	Putting things together	229
6.1	Integrating optimization methods and evaluative models . .	229
6.1.1	The Response Surface Methodology	230
6.1.2	Perturbation Analysis	232
6.1.3	Optimization with queueing models	234
6.2	Optimal control of failure-prone manufacturing systems . .	236
6.3	Model management and modeling languages	239
	For further reading	243
	APPENDICES	244
A	Fundamentals of Mathematical Programming	245
A.1	Convex sets and convex functions	246
A.1.1	Qualitative properties of mathematical programming problems	248
A.2	Unconstrained optimization problems	250
A.3	Numerical methods for unconstrained optimization	251
A.4	Constrained optimization problems	253
A.4.1	The penalty function approach	254
A.4.2	Multiplier methods: optimization with equality constraints	255
A.4.3	Multiplier methods: optimization with inequality constraints	259
A.4.4	Kuhn-Tucker conditions for the general constrained problem	260
A.4.5	Interpreting dual variables	262
A.5	Duality theory	264
A.6	Decomposition of large-scale optimization problems	270
A.7	Nonsmooth optimization	272
	For further reading	277
B	Linear Programming and Network Optimization	278
B.1	Background	279
B.1.1	Convex polyhedra and polytopes	279
B.1.2	Graph Theory	281
B.2	The standard and canonical forms of LP problems	282
B.3	Geometric and algebraic features of Linear Programming . .	287

B.4	The Simplex method	289
B.4.1	Getting a starting basis	294
B.4.2	Computational issues and interior point methods	294
B.5	Duality in Linear Programming	296
B.5.1	Applications of LP duality	297
B.6	Network Optimization	299
B.6.1	The minimum cost flow problem	300
B.6.2	The transportation problem	301
B.6.3	The maximum flow problem	302
B.6.4	The Shortest and Longest Path problems	302
B.6.5	The Traveling Salesman Problem	303
B.7	Total unimodularity	304
	For further reading	306
C	Enumerative and Heuristic Methods for Discrete Optimization	307
C.1	Classical discrete optimization problems	308
C.2	Modeling with binary variables	314
C.2.1	Expressing logical constraints	314
C.2.2	Modeling piecewise linear objective functions	315
C.2.3	Modal formulations	317
C.2.4	Linearizing nonlinear 0/1 problems	319
C.3	Branch and Bound methods	319
C.4	Relaxation methods for bounding	323
C.4.1	Constraints elimination	323
C.4.2	Continuous relaxation	323
C.4.3	Lagrangian relaxation	324
C.4.4	Surrogate relaxation	326
C.4.5	Comparing alternative relaxations	326
C.5	Branching strategies	328
C.5.1	Branching for MILP models	328
C.5.2	Branching in special purpose Branch and Bound algorithms	330
C.5.3	Selecting the branching variable	330
C.5.4	Obtaining feasible solutions	332
C.6	Search strategies	332
C.7	Dominance conditions	333
C.8	Heuristic methods for discrete optimization	334
C.8.1	Heuristics from mathematical models	335
C.8.2	Greedy algorithms	335
C.8.3	Truncated exponential schemes	336
C.8.4	Local Search	337
	For further reading	344

D Dynamic Programming	346
D.1 The shortest path problem	346
D.2 Sequential decision processes	349
D.2.1 The optimality principle and solving the functional equation	351
D.3 Dynamic Programming for infinite-dimensional problems . .	354
For further reading	356
E Stochastic modeling	357
E.1 Motivation	357
E.1.1 A refresher on Probability Theory and random vari- ables	360
E.1.2 Memoryless random variables	362
E.2 Stochastic processes and Markov chains	364
E.2.1 The Poisson process	364
E.2.2 Discrete-time Markov chains	366
E.2.3 Continuous-time Markov chains	368
E.3 Steady-state analysis of Markov chains	369
E.3.1 Steady-state analysis of DTMCs	369
E.3.2 Steady-state analysis of CTMCs	372
E.3.3 An example: steady-state analysis of a birth-death process	374
For further reading	375
Problems	376
Bibliography	384
Index	399
