<i>Preface</i>	<i>vii</i>
<i>1 Financial problems and numerical methods</i>	<i>3</i>
1.1 <i>MATLAB environment</i>	<i>4</i>
1.1.1 <i>Why MATLAB?</i>	<i>5</i>
1.2 <i>Fixed-income securities: analysis and portfolio immunization</i>	<i>6</i>
1.2.1 <i>Basic valuation of fixed-income securities</i>	<i>7</i>
1.2.2 <i>Interest rate sensitivity and bond portfolio immunization</i>	<i>14</i>
1.2.3 <i>MATLAB functions to deal with fixed-income securities</i>	<i>17</i>
1.2.4 <i>Critique</i>	<i>26</i>
1.3 <i>Portfolio optimization</i>	<i>27</i>
1.3.1 <i>Basics of mean-variance portfolio optimization</i>	<i>30</i>
1.3.2 <i>MATLAB functions to deal with mean-variance portfolio optimization</i>	<i>32</i>
1.3.3 <i>Critique</i>	<i>39</i>
1.4 <i>Derivatives</i>	<i>41</i>
1.4.1 <i>Modeling the dynamics of asset prices</i>	<i>46</i>

1.4.2	<i>Black-Scholes model</i>	52
1.4.3	<i>Black-Scholes model in MATLAB</i>	54
1.4.4	<i>Pricing American options by binomial lattices</i>	57
1.4.5	<i>Option pricing by Monte Carlo simulation</i>	65
1.5	<i>Value-at-risk</i>	66
S1.1	<i>Stochastic differential equations and Ito's lemma</i>	70
	<i>References</i>	72
2	<i>Basics of numerical analysis</i>	75
2.1	<i>Nature of numerical computation</i>	76
2.1.1	<i>Working with a finite precision arithmetic</i>	76
2.1.2	<i>Number representation, rounding, and truncation</i>	80
2.1.3	<i>Error propagation and instability</i>	82
2.1.4	<i>Order of convergence and computational complexity</i>	83
2.2	<i>Solving systems of linear equations</i>	84
2.2.1	<i>Condition number for a matrix</i>	85
2.2.2	<i>Direct methods for solving systems of linear equations</i>	88
2.2.3	<i>Tridiagonal matrices</i>	92
2.2.4	<i>Iterative methods for solving systems of linear equations</i>	93
2.3	<i>Function approximation and interpolation</i>	102
2.4	<i>Solving nonlinear equations</i>	109
2.4.1	<i>Bisection method</i>	110
2.4.2	<i>Newton's method</i>	111
2.4.3	<i>Solving nonlinear equations in MATLAB</i>	112
2.5	<i>Numerical integration</i>	115
	<i>References</i>	119
3	<i>Optimization methods</i>	121
3.1	<i>Classification of optimization problems</i>	121
3.1.1	<i>Finite- vs. infinite-dimensional problems</i>	122
3.1.2	<i>Unconstrained vs. constrained problems</i>	126
3.1.3	<i>Convex vs. nonconvex problems</i>	127
3.1.4	<i>Linear vs. nonlinear problems</i>	128
3.1.5	<i>Continuous vs. discrete problems</i>	130

3.1.6	<i>Deterministic vs. stochastic problems</i>	134
3.2	<i>Numerical methods for unconstrained optimization</i>	139
3.2.1	<i>Steepest descent method</i>	140
3.2.2	<i>The subgradient method</i>	141
3.2.3	<i>Newton and the trust region methods</i>	141
3.2.4	<i>No-derivatives algorithms: quasi-Newton method and simplex search</i>	142
3.2.5	<i>Unconstrained optimization in MATLAB</i>	144
3.3	<i>Methods for constrained optimization</i>	146
3.3.1	<i>Penalty function approach</i>	147
3.3.2	<i>Kuhn-Tucker conditions</i>	152
3.3.3	<i>Duality theory</i>	157
3.3.4	<i>Kelley's cutting plane algorithm</i>	163
3.3.5	<i>Active set method</i>	164
3.4	<i>Linear programming</i>	166
3.4.1	<i>Geometric and algebraic features of linear programming</i>	168
3.4.2	<i>Simplex method</i>	170
3.4.3	<i>Duality in linear programming</i>	172
3.4.4	<i>Interior point methods</i>	174
3.4.5	<i>Linear programming in MATLAB</i>	177
3.5	<i>Branch and bound methods for nonconvex optimization</i>	178
3.5.1	<i>LP-based branch and bound for MILP models</i>	184
3.6	<i>Heuristic methods for nonconvex optimization</i>	187
3.7	<i>L-shaped method for two-stage linear stochastic programming</i>	192
S3.1	<i>Elements of convex analysis</i>	195
S3.1.1	<i>Convexity in optimization</i>	195
S3.1.2	<i>Convex polyhedra and polytopes</i>	199
	<i>References</i>	202
4	<i>Principles of Monte Carlo simulation</i>	205
4.1	<i>Monte Carlo integration</i>	206
4.2	<i>Generating pseudorandom variates</i>	208
4.2.1	<i>Generating pseudorandom numbers</i>	208
4.2.2	<i>Inverse transform method</i>	210

4.2.3	<i>Acceptance-rejection method</i>	211
4.2.4	<i>Generating normal variates by the polar approach</i>	213
4.3	<i>Setting the number of replications</i>	216
4.4	<i>Variance reduction techniques</i>	218
4.4.1	<i>Antithetic variates</i>	218
4.4.2	<i>Common random numbers</i>	222
4.4.3	<i>Control variates</i>	224
4.4.4	<i>Variance reduction by conditioning</i>	225
4.4.5	<i>Stratified sampling</i>	225
4.4.6	<i>Importance sampling</i>	227
4.5	<i>Quasi-Monte Carlo simulation</i>	232
4.5.1	<i>Generating Halton's low-discrepancy sequences</i>	233
4.5.2	<i>Generating Sobol's low-discrepancy sequences</i>	239
4.6	<i>Integrating simulation and optimization</i>	244
	<i>References</i>	247
5	<i>Finite difference methods for partial differential equations</i>	249
5.1	<i>Introduction and classification of PDEs</i>	250
5.2	<i>Numerical solution by finite difference methods</i>	254
5.2.1	<i>Bad example of a finite difference scheme</i>	255
5.2.2	<i>Instability in a finite difference scheme</i>	257
5.3	<i>Explicit and implicit methods for second-order PDEs</i>	263
5.3.1	<i>Solving the heat equation by an explicit method</i>	264
5.3.2	<i>Solving the heat equation by an implicit method</i>	268
5.3.3	<i>Solving the heat equation by the Crank-Nicolson method</i>	272
5.4	<i>Convergence, consistency, and stability</i>	273
S5.1	<i>Classification of second-order PDEs and characteristic curves</i>	275
	<i>References</i>	277
6	<i>Optimization models for portfolio management</i>	279
6.1	<i>Mixed-integer programming models</i>	281
6.2	<i>Multistage stochastic programming models</i>	285

6.2.1	<i>Split-variable formulation</i>	288
6.2.2	<i>Compact formulation</i>	293
6.2.3	<i>Sample asset and liability management model formulation</i>	297
6.2.4	<i>Scenario generation for multistage stochastic programming</i>	299
6.3	<i>Fixed-mix model based on global optimization</i>	305
	<i>References</i>	308
7	<i>Option valuation by Monte Carlo simulation</i>	311
7.1	<i>Simulating asset price dynamics</i>	312
7.2	<i>Pricing a vanilla European option by Monte Carlo simulation</i>	315
7.2.1	<i>Using antithetic variates to price a vanilla European option</i>	317
7.2.2	<i>Using antithetic variates to price a European option with truncated payoff</i>	318
7.2.3	<i>Using control variates to price a vanilla European option</i>	319
7.2.4	<i>Using Halton low-discrepancy sequences to price a vanilla European option</i>	321
7.3	<i>Introduction to exotic and path-dependent options</i>	322
7.3.1	<i>Barrier options</i>	322
7.3.2	<i>Asian options</i>	326
7.3.3	<i>Lookback options</i>	327
7.4	<i>Pricing a down-and-out put</i>	328
7.5	<i>Pricing an Asian option</i>	336
	<i>References</i>	341
8	<i>Option valuation by finite difference methods</i>	343
8.1	<i>Applying finite difference methods to the Black- Scholes equation</i>	343
8.2	<i>Pricing a vanilla European option by an explicit method</i>	346
8.2.1	<i>Financial interpretation of the instability of the explicit method</i>	348
8.3	<i>Pricing a vanilla European option by a fully implicit method</i>	350
8.4	<i>Pricing a barrier option by the Crank-Nicolson method</i>	353

8.5	<i>Dealing with American options</i>	354
	<i>References</i>	360
<i>Appendix A Introduction to MATLAB programming</i>		361
A.1	<i>MATLAB environment</i>	361
A.2	<i>MATLAB graphics</i>	368
A.3	<i>MATLAB programming</i>	369
<i>Appendix B Refresher on probability theory</i>		373
B.1	<i>Sample space, events, and probability</i>	373
B.2	<i>Random variables, expectation, and variance</i>	375
	<i>B.2.1 Common continuous random variables</i>	377
B.3	<i>Jointly distributed random variables</i>	380
B.4	<i>Independence, covariance, and conditional expectation</i>	382
B.5	<i>Parameter estimation</i>	385
	<i>References</i>	389
	<i>Index</i>	391
